

Technical Memorandum
Superfund JE Model Spreadsheet Error
 By Eric Wannamaker, EnviroGroup Limited
 July 8, 2004

1. Summary

An error was recently discovered in one of the cells of the GW-Screen-040903 version of the US EPA Superfund version of the Johnson and Ettinger Model¹. Some of the California DTSC versions of the JE model are affected as well (see Table 1, below). The cell formula error causes the capillary zone total porosity to be the same as vadose zone, even if different soil types are selected. Therefore, this error only affects the calculations if the vadose zone and capillary zone soils are different. Although in most cases the difference in results is small, in some cases it can be more significant.

2. Detailed Description

Cell H10 in sheet INTERCALCS, defining the capillary zone soil moisture, is currently DATAENTER!J44. However, Cell J44 in sheet DATAENTER is the user entered vadose zone soil porosity. The correct formula for cell H10 is as follows:

=VLOOKUP(DATENTER!G29,Soil_Data,6,FALSE).

This formula looks up the capillary zone total porosity based on the user entered capillary zone soil type (cell G29 in sheet DATAENTER).

3. Known versions of the JE model affected

GW-adv version is not affected because of its formulation for soil stratigraphy. **Soil-gas** versions of the model are not affected because they do not consider the capillary zone.

Table 1. Model versions affected by spreadsheet model error.

Source	Website	Spreadsheet Name	Description
USEPA	http://www.epa.gov/superfund/programs/risk/airmodel/johnson_ettinger.htm	GW-SCREEN-040903.xls	Basic groundwater screening spreadsheet.
Cal. DTSC	http://www.dtsc.ca.gov/science/technology/je_models.html	Screen_Level_Model_Groundwater_Coarse_Soil.xls* Screen_Level_Model_Groundwater_Fine_Soil.xls** Screen_Level_Model_Groundwater_Unclassified_Soil.xls	California specific basic groundwater screening spreadsheets.

¹ Helen Dawson, US EPA Region 8, personal communication.

*As configured, spreadsheet avoids error (vadose zone / capillary zone soil types identical).

**As configured, spreadsheet subject to error (vadose zone / capillary zone soil types are different).

4. Test Case

A suite of model runs was performed using different soil types to gauge the impact of this error. The model was run using TCE and a set of default parameters (see Appendix A). Tables 2 and 3 indicate the relative effects on indoor exposure groundwater concentrations for different soil type combinations.

Table 2. Results of JE Spreadsheet Model Error Comparison Study.

Run	Vadose Zone Soil Type	Capillary Zone Soil Type	Final indoor exposure groundwater conc., (µg/L)	Final indoor exposure groundwater conc., (µg/L) (with error)	% Difference
1	Sand	Sand	0.11	0.11	0%
2	Sand	Loamy Sand	0.23	0.35	52%
3	Sand	Sandy Loam	0.58	0.93	60%
4	Sand	Loam	0.87	2.40	175%
5	Loamy Sand	Sand	0.11	0.10	-12%
6	Loamy Sand	Loamy Sand	0.24	0.24	0%
7	Loamy Sand	Sandy Loam	0.58	0.52	-10%
8	Loamy Sand	Loam	0.88	1.25	43%
9	Sandy Loam	Sand	0.12	0.11	-9%
10	Sandy Loam	Loamy Sand	0.24	0.26	7%
11	Sandy Loam	Sandy Loam	0.59	0.59	0%
12	Sandy Loam	Loam	0.89	1.42	60%
13	Loam	Sand	0.14	0.12	-14%
14	Loam	Loamy Sand	0.27	0.22	-16%
15	Loam	Sandy Loam	0.61	0.42	-31%
16	Loam	Loam	0.90	0.90	0%

Table 3. Matrix of JE Error Effect on Final Indoor Exposure Groundwater Concentration (Percent Error)

		Capillary Zone Soil Type			
		Sand	Loamy Sand	Sandy Loam	Loam
Vadose Zone Soil Type	Sand	0%	52%	60%	175%
	Loamy Sand	-12%	0%	-10%	43%
	Sandy Loam	-9%	7%	0%	60%
	Loam	-14%	-16%	-31%	0%
